

Getting started

This guide assumes that you're familiar with DuneX operations and that your movie collection has already been loaded into DuneX.

Please take note that DuneX does not "clean" its library whenever you add, remove or move items within your folders structure.

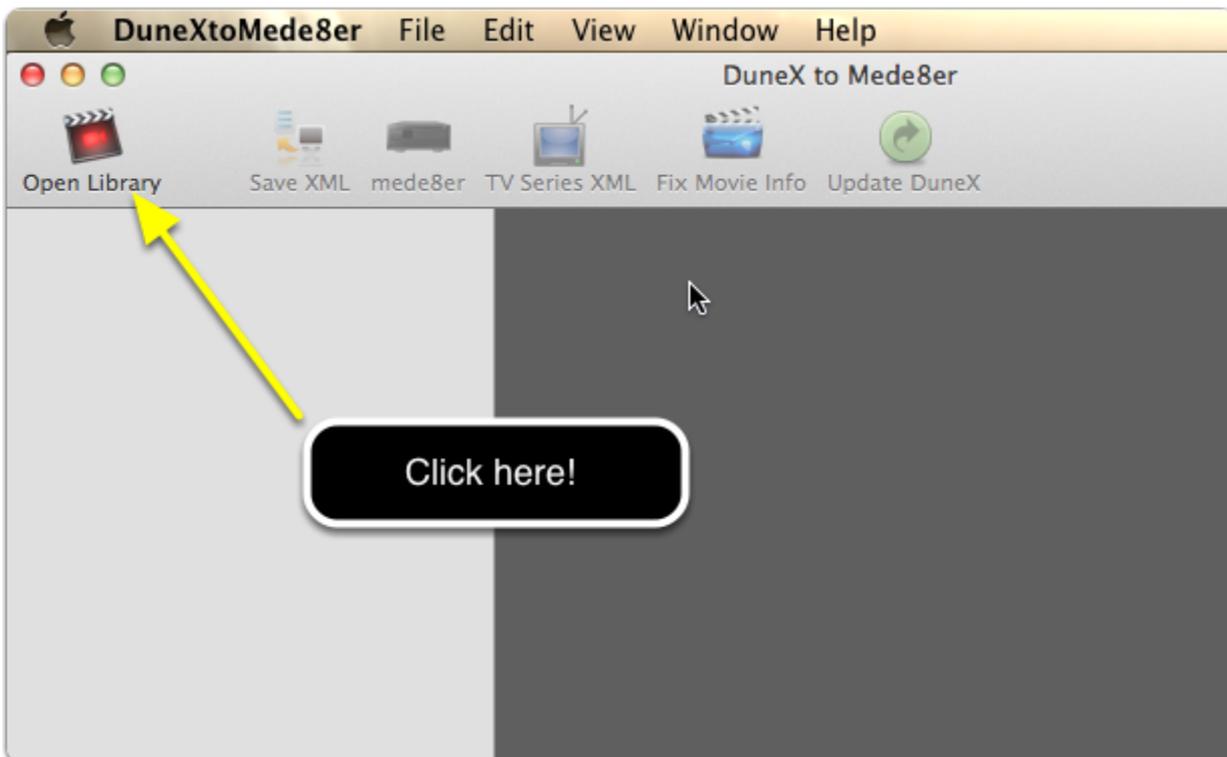

In order to get the cleanest environment possible, please issue *RELOAD* and *CLEAN* commands for each of your library paths in DuneX.

When everything is properly set up, you must shut DuneX down in order to commit changes to your library and, finally, open DuneX2Mede8er.

The very first thing to do is opening the DuneX library file: do this by clicking on the toolbar item pointed by the yellow arrow, or by choosing **File-> Open**.

Depending on whether you chose to load thumbnails or not, please allow some time for the process to complete. On a 13" MacBook Pro, hardly a lightning fast machine, it takes *1 minute and 35 seconds* to load a library of **801** items together with their thumbnails, against a time of *23 seconds* to load the same library **without** thumbnails!

Remember: if you get stuck, at any point during operations, you can check this guide accessing its online version directly from the **Help** menu item.

The toolbar

Let's take a look at what you got in the toolbar:

1. **Open Library.** Select and open the DuneX library file in XML format
2. **Save XML.** Click to have the application produce the relevant XML files for the selected movie or for each of the movies in the selected folder. This function needs read/write access to the file system where the item(s) is located.
3. **mede8er.** Builds and writes the mede8er.db database for the selected folder. The database is required by Mede8er Jukebox and normally is built by the firmware with the "Scan folder" function. This function needs read/write access to the file system where the item(s) is located.
4. **TV Series XML.** Produces all the files needed to enjoy the TV Jukebox offered by the latest version of X2 series firmware; this function needs read/write access to the file system where the item(s) is located.
5. **Query Library.** Brings up the query form window. See related pages for a full description of this function.
6. **Fix Movie Info.** Clicking on this button starts a search on TMDb for the movie selected. If any of the field in this panel is empty (showing "missing info") it will be filled with the data retrieve on TheMovieDB. You can specify which language to use in the setting panel (see later on).
7. **Update DuneX.** This is available only if you use "Fix Movie Info"; the updated informations will be written back to the DuneX library file and thus available both to DuneX and DuneX2Mede8er form now on...

Most of these features are also available through the application menu, in the **File** and **Tools** sections.

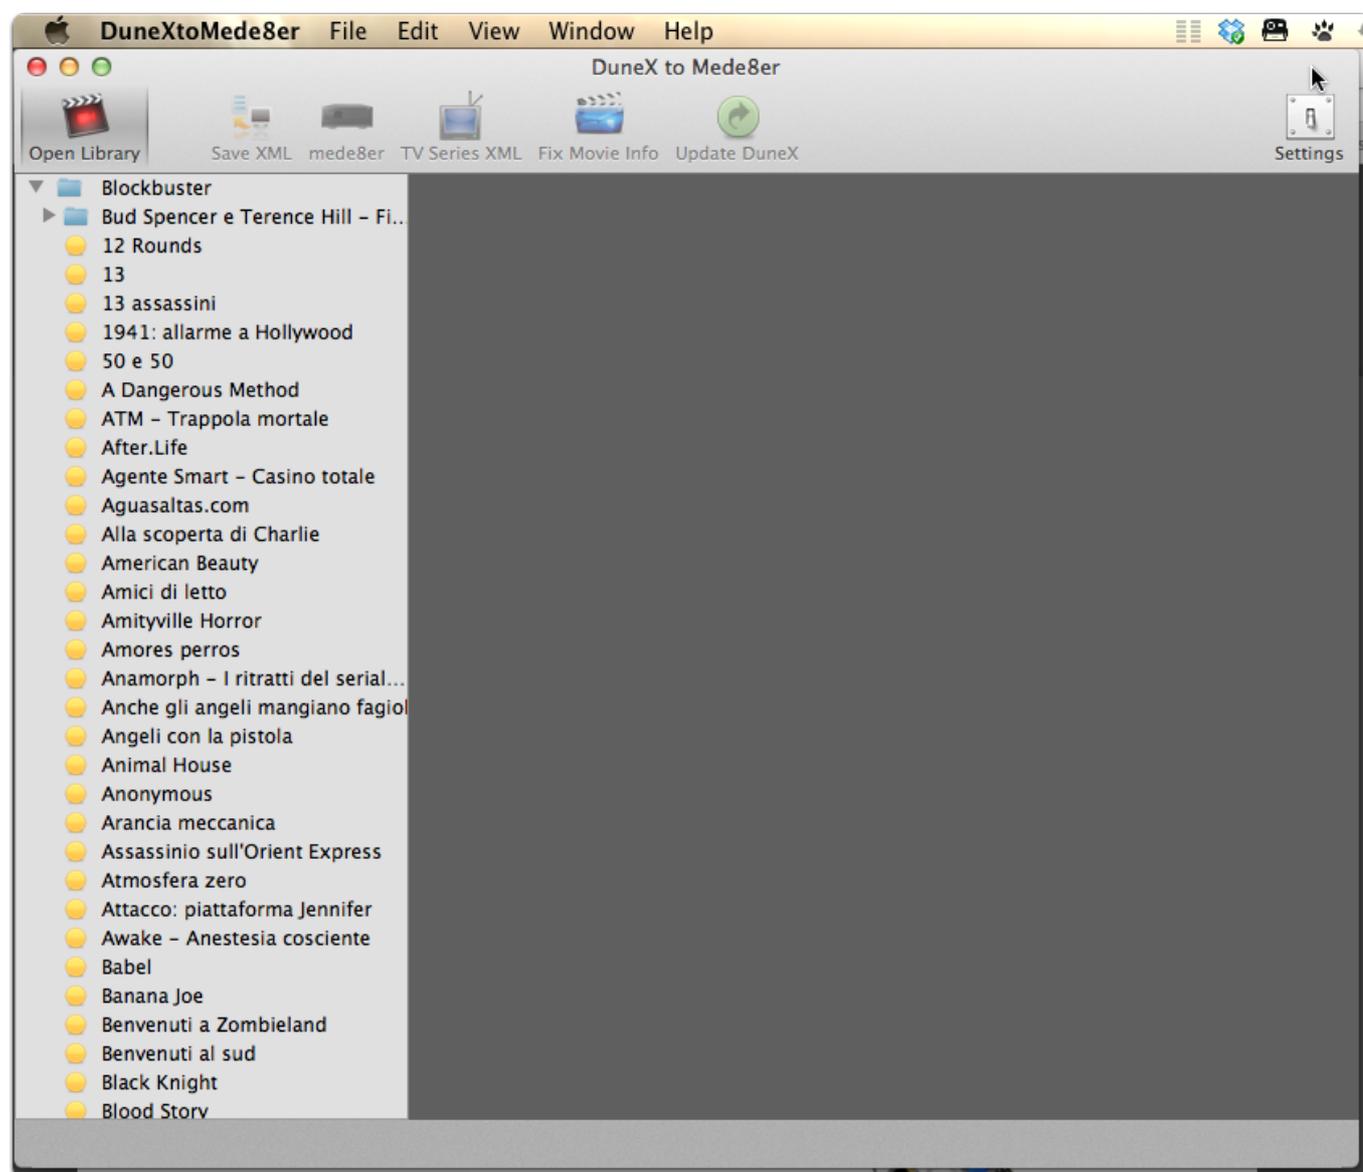

The Library outline view

Once the library is loaded, you can easily browse it using the outline view on the left.

You can expand or collapse each node in the tree, by clicking on the small triangle at its left. You can also expand or collapse ALL the root nodes by choosing View-> Expand all items or View-> Collapse all items.

Selecting a folder will show the Library Details panel, while selecting a single movie/TV episode will show the relevant details panel (see following pages); the number of available functions depends on which mode you've entered.

The Library Details panel

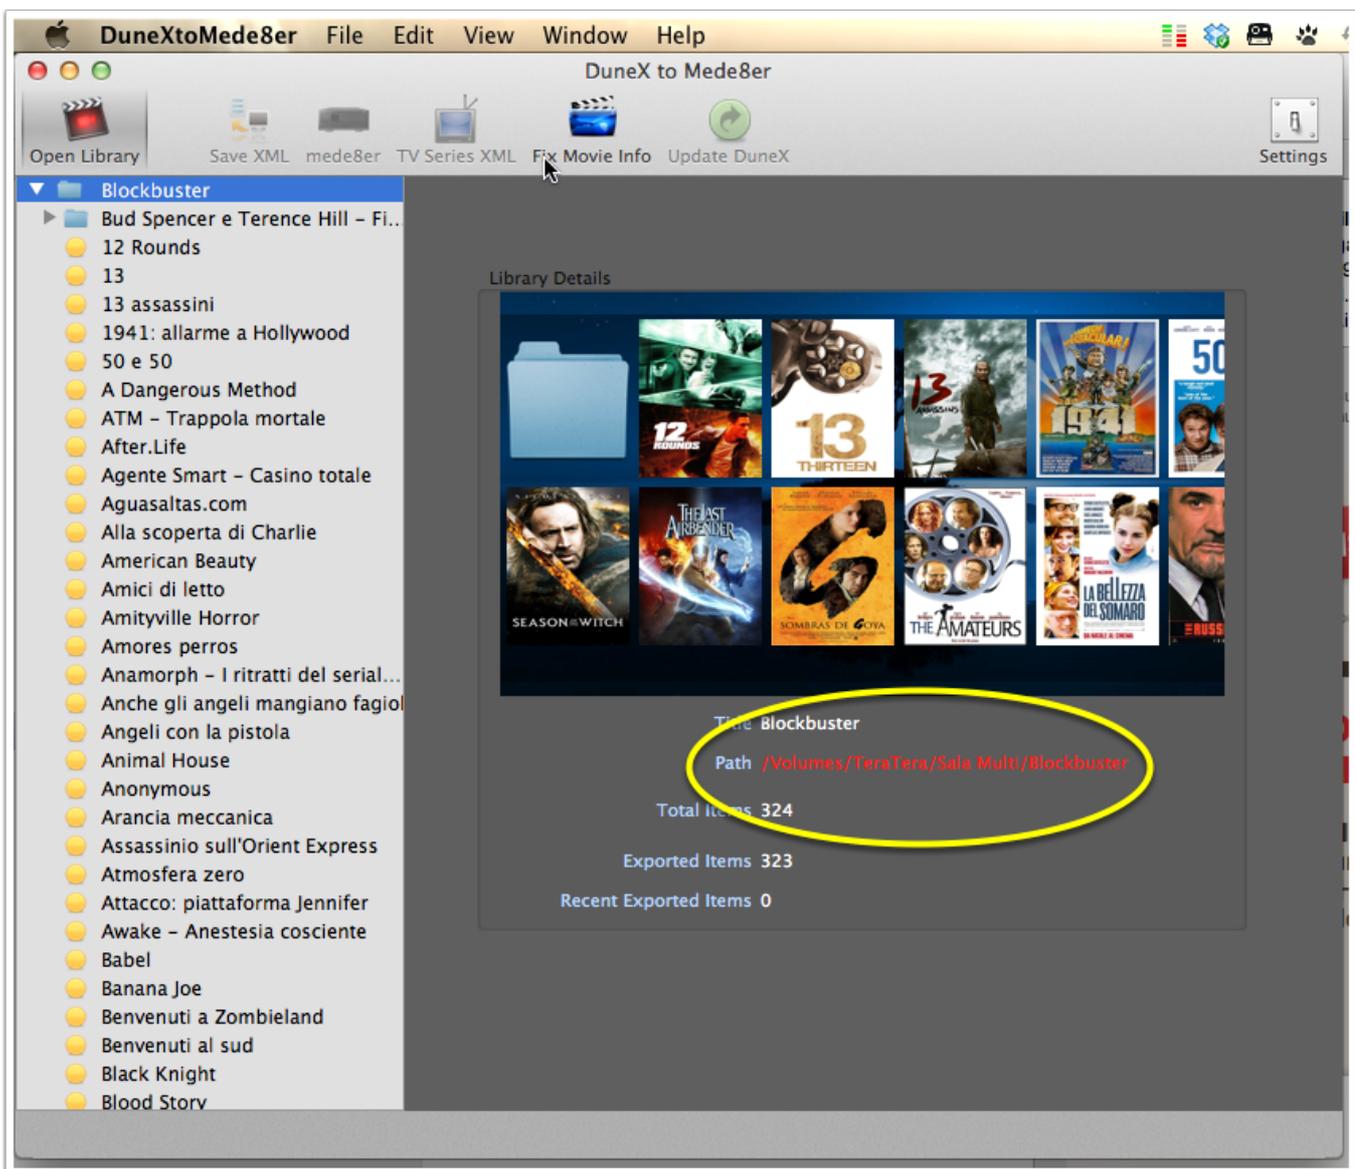

If you select a folder, whether it being a root folder or a subfolder, you'll be presented with a scrolling view of your movies' thumbnails and a recap of the status of the items within the folder. Thumbnails are shown only if you chose to do so in the *Preferences* panel (default is NO).

Either way, hovering the mouse pointer above the folder thumbnails will show the movie title.

Take a look at the path field in the example: if it is written in red, it means that this particular folder has not been mounted on your Mac and therefore it is not writable. A green colored path means that everything is okay.

Exported items represents the number of movies, in the selected folder, already exported by DuneX. Count is recursive and traverses all subfolders.

Recently Exported items gives you the count of those movies exported since the last time you ran DuneX2Mede8er

The Movie Details panel

This is what you get when selecting a single movie in the outline view on the left. All the informations presented on the screen are read straight from DuneX library file.

The colour of the movie title reflects at a glance the file system status of the movie file: red means no access while a green title represents the correct file system status (read/write access to the file).

Pay attention to the colored ball near the *Export date* (and in the outline view on the left):

- **red**: item has never been exported by DuneX, thus cannot be processed by DuneX2Mede8er;
- **yellow**: item has already been exported before last run of DuneX2Mede8er and should not receive any further attention; it is possible to force processing of these items;
- **green**: item has been exported after your last run of DuneX2Mede8er and thus is fully processable.

Tip: hovering the mouse pointer above the poster/cover of the movie will pop-up a tooltip with some technical info about the movie.

Movie details

Title Amores perros

Year 2000

Director Alejandro González Iñárritu

Cast Emilio Echevarría, Gael García Bernal, Goya Toledo, Álvaro Guerrero, Vanessa Bauche

Genre Drammatico, Thriller

Duration 154 min

Rating 8.2

Export 2012-06-13 ●

Plot
 In un incidente stradale a Città del Messico tre vite si scontrano : Octavio ha deciso di fuggire con la moglie del fratello e decide di far partecipare il suo cane Cofi alle lotte clandestine tra cani, per racimolare i soldi necessari alla fuga. Daniel s'è separato dalla moglie per andare a vivere con Valeria, una modella. El Chivo ex guerrigliero deluso dalla vita si prende cura di Cofi, rimasto ferito nell'incidente.

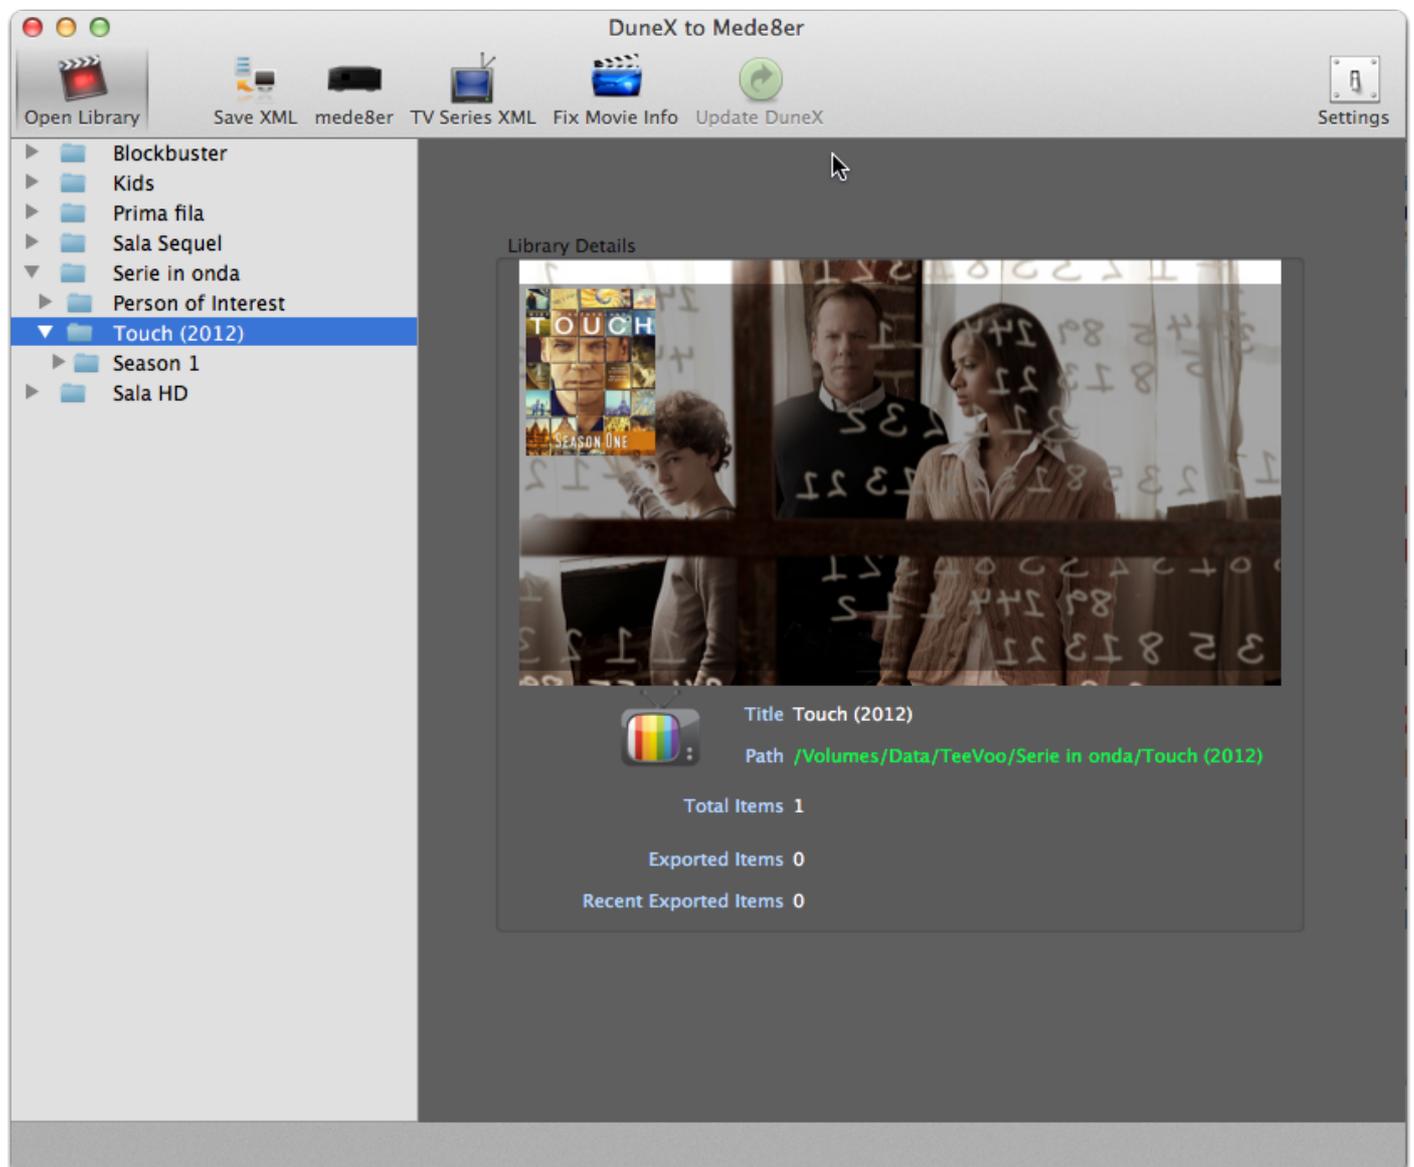

TV Series mode

This is what you get while clicking on a folder which DuneX identifies as "TV Show". A little TV Icon helps you understand that you're dealing with a TV Series structure. *Exported items* and *Recently Exported items* have the very same meaning to the movie library view.

By using the button "TV Series XML", DuneX2Mede8er automatically produce the structure (XML and JPG) required for the new TV Series Jukebox.

This function is still experimental, so use it with care!!! In any case nothing will be deleted or modified, so your original files will be safe...

While you're here, take note of the path field: this time is green colored, because this path is actually mounted on the computer where the screenshot was taken.

TV Series - Episode details

Here you can see the episode detail view.

Only basic informations such as plot and title are shown, along with export date and status.

Episode details

Legami di famiglia

Plot [Export](#) [missing info](#) ●

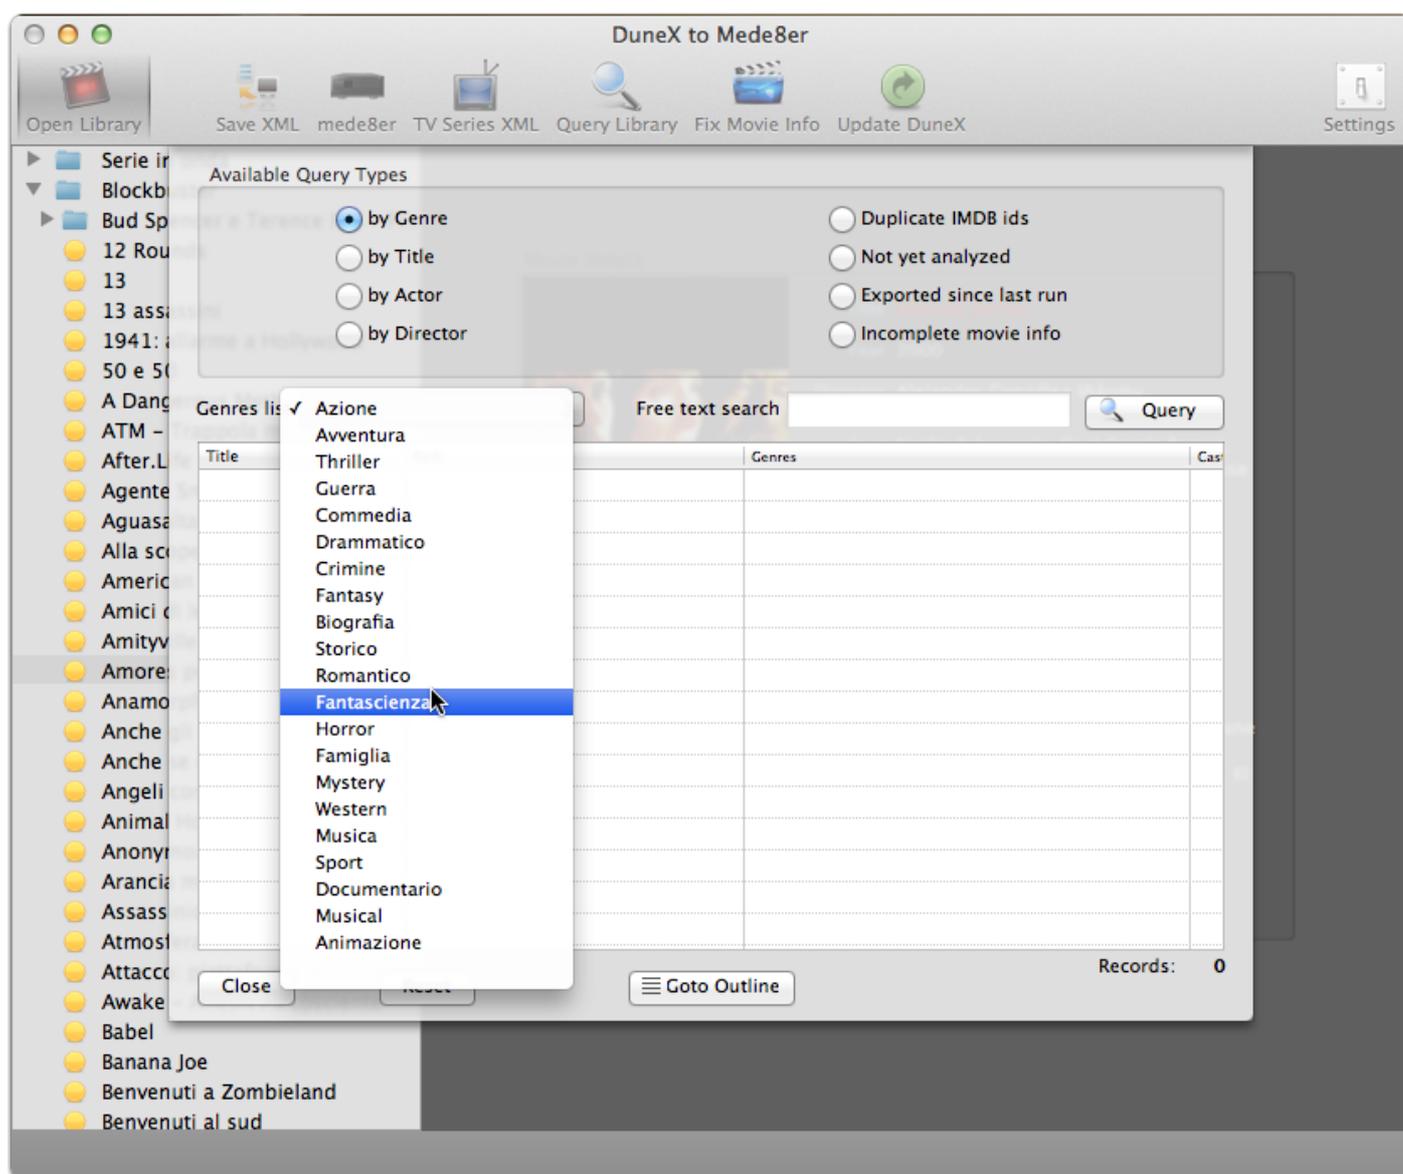

Martin gets his laptop stolen on the day Jake is scheduled for an important evaluation. As a result, he becomes ensnared in a young Salvadoran woman's quest to avenge the death of her family. Meanwhile, Teller (guest star Danny Glover) tries to reconnect with his estranged daughter. Also, a spirited Saudi Arabian girl tries to break free of the societal constraints imposed on her and a Montreal doctor attempts to meet a stranger on a train.

Library Query *NEW*

Imagine you're dealing with a huge and complex library: tracking your movies, their position and their status, it is not an easy task to accomplish.

Starting with version 1.4, DuneX2Mede8er offers you the chance to **query your library** and easily manage the resulting items. You can search for:

- Genres (or categories), selecting from a drop down menu compiled using the categories used by your movies and not some unuseful standard set
- Titles, cast and directors, using free text, case-insensitive, text searching with automatic wildcard
- Duplicated IMDB Ids: get rid of those duplicated movies scattered all around your library
- Movies that need analysis by DuneX
- Movies with incomplete info (spot, actors, directors...) so you can use DuneX2Mede8er to fix the missing info before writing your precious XML files
- Items that you exported from DuneX since the last time you ran DuneX2Mede8er: all your new releases at a glance!

Library Query - perform queries

Querying the library is simply a matter of choosing the query type, selecting parameter if required, and clicking on the **Query** button.

The queries that need a parameter are listed on the left, while those on the right are ready to be executed as is.

Once executed, the query produces its results in the form of a table whose columns are:

- **Title**
- **Path**
- **Genres**
- **Cast**

You will also find the count of the resulting items In the lower right corner of the table.

Selecting a row a clicking on **Goto Outline** will take you to the outline mode with the selected item highlighted in movie details view. You can achieve the same result by double-clicking on a single row.

Clicking on **Reset** will clear the result table and the parameter field; also the query selection will reset to the default choice (by Genre).

The **Close** button will dispose of the query window, taking you back to the outline view without affecting the currently selected item (movie or folder).

Click to view the selection in outline view mode

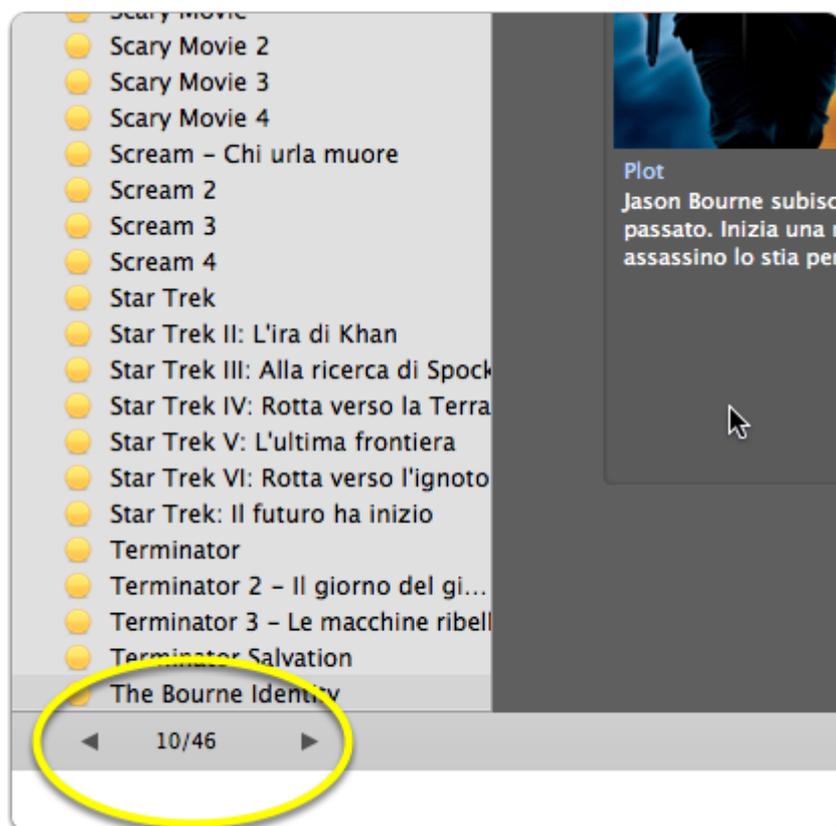

Library Query - navigating the results

Once you've got back to outline view, either by clicking on the "**Goto Outline**" button or by **double-clicking on a selected item** in the Query window, you can use the highlighted controls to cycle through the items resulting from your query.

Each item will be highlighted in its position in the outline tree, automatically collapsing and expanding nodes as required and updating the contents of the movie/TV episode details panel.

Those controls will track your position inside the *result set* and will remember the content of the result set even you manually change focus in the outline tree; the controls will be cleared only if you click on the **Reset** button in the query window.

While in outline view, you can freely select any other item, movie or folder, regardless of it being a result item or not; you can go back to the whole result set by click on the Library Query button in the toolbar or continue cycling through the set by using the arrow-shaped controls.

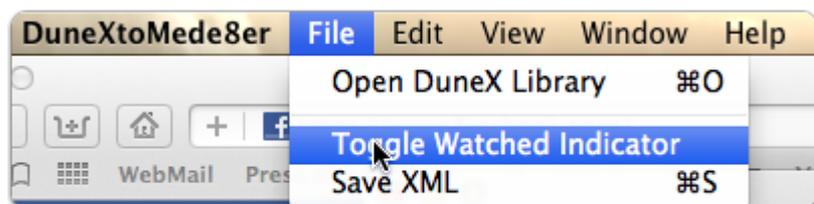

Manage "watched" status

Version 1.3 adds a new menu item, under the File section, to easily toggle the watched indicator on and off, for each individual movie.

This function works only at movie level and is therefore not available when an entire folder is selected in outline view.

Warning: this function requires write access to the file system where the movie is located, as managing the watched status implies writing or deleting a particular file.

Check "watched" status

You can always check whether a movie has been "watched" looking for the "eye" icon in the movie details view, as you can see in the following example.

Warning: this function requires read-only (at least) access to the file system where the movie is located, as managing the watched status implies reading a particular file.

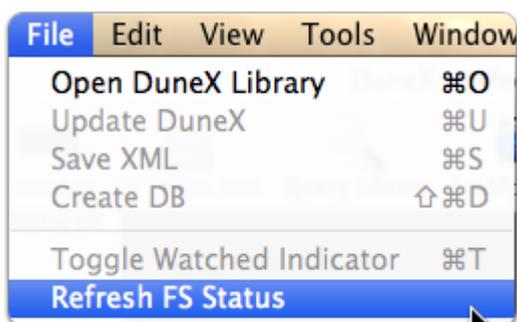

Refresh file system status*NEW*

You launch DuneX2Mede8er to update your library with some new release; so you load your 1000+ items library and start working, only to notice that you forgot to mount the disks (local or network) where your movies are. You're stuck, 'cause DuneX2Mede8er cannot do its job...

Since file system status is normally checked when loading the library, you're required to quit the application, do the appropriate mounting, launch once more DuneX2Mede8er and reload your library. What a waste of time!

This pain it's over: simply use the new function in file menu called "Refresh FS status" after mounting your disks (no need to quit the application), and DuneX2Mede8er will update its library reference so you can perform your due maintenance.

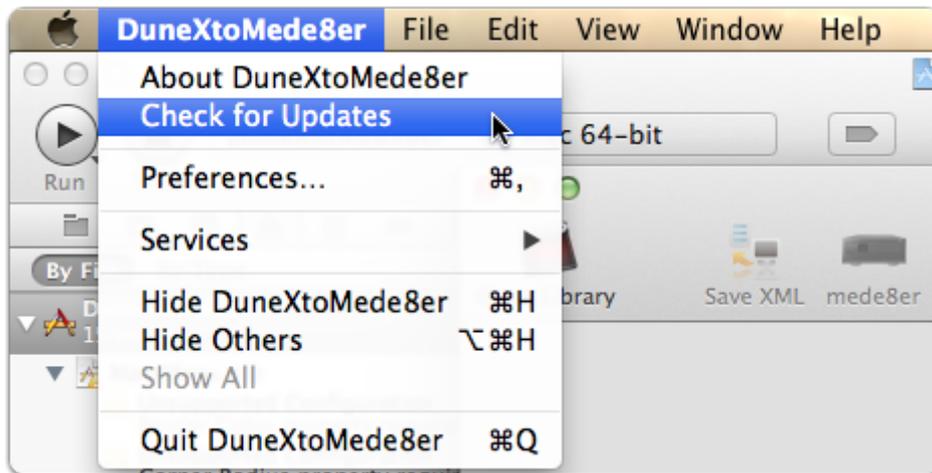

You can always check if a folder/movie is accessible or not, by looking at the color of its title in the detail panel: green is okay, red means "no way"!

DuneX compatibility and automatic updates

Starting with version 1.3, DuneX2Mede8er is compatible with the soon-to-be-released version 0.9 of *DuneX*; *DuneX* has undergone a lot of changes and I made every effort possible to make *DuneX2Mede8er* work with this new version while retaining backward compatibility with the current stable version of DuneX.

Also version 1.3 introduces **automatic updates** through the use of the wonderful *Sparkle* framework (<http://sparkle.andymatuschak.org>). DuneX2Mede8er checks his home website (www.myrtaart.com) for an appcast XML which lists available updates along with a detailed changelog. Checking is performed automatically if the relative setting is checked in the preferences panel, but can also be forced using the following menu item...

The Preferences panel

Here is a screenshot of the "Settings" panel:

1. Choose your preferred *language* for scraping with **TheMovieDB**
2. When checked, it creates automatically the **mede8er.db** whenever you perform the **Save XML** action on a library folder.
3. When checked, it searches automatically on **TMDB** for updated movie infos in order to fill the voids while writing the XML files for an entire folder
4. If checked it retrieves all the poster images while loading the library from file. This is not recommended for large libraries as it has an impact on loading time and RAM usage.
5. If checked, DuneX2Mede8er will check once in a day for updates; it needs an Internet connection to www.myrtaart.com
6. DuneX2Mede8er save the date when it was last used. This information is used to identify (by color) the status of each movie. You can reset the last run date back to **January, 1st 1970** by clicking on the button *Reset*.
